

doXmind Sidecar Migration Plan

Working draft · Q2 2026

doXmind Mini is the local sidecar edition: a desktop document editor where every workbook lives next to its source on disk. The Markdown facade stays portable, while the hidden `.doxmind` sidecar carries the rich editor HTML and any doXmind-only block data.

This document exists so the PDF editor has a real test fixture: paragraphs with sentence-level whitespace, a heading hierarchy, and a multi-page layout. Open it inside the editor to verify that paragraphs are detected as flowable blocks rather than per-run glyph clusters.

Goals for the migration:

- Markdown remains the user-facing source of truth.
- Sidecar holds editor HTML and block extras (databases, etc.).
- External edits to Markdown invalidate the sidecar on next open.
- Database-block data eventually lives in `extras.databases`.

Open algorithm

1. Read the `.md` file and split frontmatter from the body.
2. Look for a same-name hidden `.doxmind` sidecar in the parent directory.
3. If the sidecar is missing, import the Markdown into editor HTML.
4. If present and the `markdown_hash` matches, use the sidecar's HTML.
5. If the hash differs, treat external Markdown edits as authoritative.

Out-of-scope features

The local sidecar edition deliberately drops several surfaces from earlier branches. None of these should reappear by accident.

Removed: JWT auth, OAuth login, Stripe billing, credit quotas, sharing links, community publishing, comments, follows, bookmarks, push notifications, telemetry, RLHF reporting, S3, Postgres, Redis, hosted cloud sync, chat, agents, providers, OpenRouter, autocomplete, quick edit, document review, prompts, and knowledge-base retrieval.

If a feature has to come back, design it around the local sidecar edition first, not a remix of the cloud build.
